A 62-year-old woman presented to the Tung's MetroHarbor Hospital Out-Patient Department (OPD) with a complaint of recurrent episodes of hypoglycemia for 3-4 months. Lab data at OPD reported low blood sugar with high insulin level and abdominal CT reported hyperdense pancreas tail lesion. She was admitted for further survey.

Lab data of adrenal gland, thyroid gland and parathyroid gland function were within normal range. Brain MRI didn't show pituitary lesion. EUS localized the lesion at pancreas tail and took fine needle aspiration. Pathology (FNA) reported well-differentiated neuroendocrine tumor, in favor of insulinoma. Patient underwent daVinci robotic spleen preserved, distal pancreatectomy with intraoperative sonography. The pathology of postoperative specimen showed Well-differentiated neuroendocrine tumor, WHO grade 1, in favor of insulinoma and free of tumor margin. The patient is still receiving OPD follow-up and no hypoglycemia develop.

77-year-old male has past history of hypertension, valvular heart disease s/p operation and type II DM. He felt abdominal pain for 4 days, associated with nausea, vomiting and bloody stool. At ER, abdominal sonography showed bowel wall thickness with little ascites. Abdominal CT with contrast showed mural swelling over small intestine. Therefore, we arranged push enteroscopy for abnormal CT finding. Enteroscopy showed jejunal hematoma with ulcer. Laboratory data also showed prolong PT. Therefore, Warfarin related spontaneous intramural small-bowel hematoma was impressed and we hold Warfarin and used Vitamin K for correction of coagulation. Patient's general condition improved and discharged after one week of hospitalization.

81 y/o male with hypertension, type 2 DM and gout suffered from progressive and persistent left limbs weakness and unstable gait for 2 days after a falling. The consciousness was clear and there was no initial conscious loss or head injury. Due to suspected CVA or brain trauma, the patient was admitted for further survey. Brain CT and MRI and carotid arterial study revealed no major insult. However, C spine MRI revealed suspected malignancy invading C7 and T1 vertebral bodies to bilateral paravertebral space, left 1st and 2nd ribs and corresponding spinal canal. Whole body CT and bone scan revealed multiple sites metastasis(lung, liver, bone) and finally, endoscopy survey revealed one 5 cm ulcerative mass, favor malignancy(biopsy:tubulovillous adenoma with focal high-grade dysplasia). TEO (Transanal endoscopic operation) for wide excision of large villous tumor of rectum + pelvis bone biopsy were done and pathology revealed poorly differentiated neuroendocrine carcinoma and tubulovillous adenoma with adenocarcinoma(colon) and poorly differentiated neuroendocrine carcinoma, metastatic(bone).
